

User-Story 4

As a logged in user, **I want to** set a budget for the ticket price **in order to** find the best ticket within my budget. I am a user trying to find a good place for an event. However, I don't want to buy a ticket that is too expensive. I also don't want to manually search every single available seat to compare them for the spot and price. I want a list of good spots for my given budget that filters the ticket prices and lets me choose the best among those tickets. Therefore, there should be an input bar asking the user for a budget. It will then search and output a list of tickets within that budget that are ranked from the closest to the farthest seats. The ticket information will include its price and location as well as any event restrictions(i.e. age) applied to the ticket.
